

# *Statement*

ST. LOUIS, Oct. 17, 2016 – Peabody recognizes that fossil fuels contribute to greenhouse gas emissions, and we have a track record of advancing responsible environmental practices to help address society’s interest in managing these emissions. Across our global platform, we’re focused on conserving power and reducing greenhouse gas intensity and have achieved six consecutive years with a reduction in total greenhouse gas emissions.

For nearly two decades, we’ve advocated use of technology to lower greenhouse gas emissions in power generation and other industrial uses while investing hundreds of millions of dollars in clean coal technology projects and partnerships. As part of a balanced energy mix, greater use of high-efficiency low emissions coal technologies drive dramatic reductions in carbon emissions. Longer term, we advocate to commercialize carbon capture and storage technology, which should have policy parity with other low carbon fuels.

We will continue to work with industry, government and NGOs on how best to use technology to achieve our energy, economic and environmental goals, a path that is documented in our [Statement on Energy and Climate Change](#) and our [Corporate and Social Responsibility Report](#), which are both available on PeabodyEnergy.com.
